Talk Outline

- Background
- Northeast Lakes Project
- Modeling Lake Appeal
- Lake Volume and Depth
- Beneficiaries
- Decision Support
- Cyanobacteria Project

Background

- Ecosystem Services Research Program (ESRP)
 - 2007-2011
- Safe and Sustainable Water Resources (SSWR)
 - 2012-??
- Common Denominator
 - Lakes
 - Nutrients

Northeast Lakes Ecosystem Services Project

Project on Lakes Ecosystem Services

- Research Questions:
 - How do changes in nutrients change delivery of ecosystem services?
 - How do spatial arrangement of services impact delivery of those services?
- Project Goals:
 - Data Sharing
 - Reproducible Research
 - Decision Support

Ecosystem Services in Lakes

- Swimming
- Fishing
- Drinking Water
- Property Values
- Existence Value
- Aesthetics

How are lakes perceived in the National Lakes Assessment?

- Aesthetic Appeal
- Disturbance
- Biotic Integrity
- Recreational Value
- Swimmability

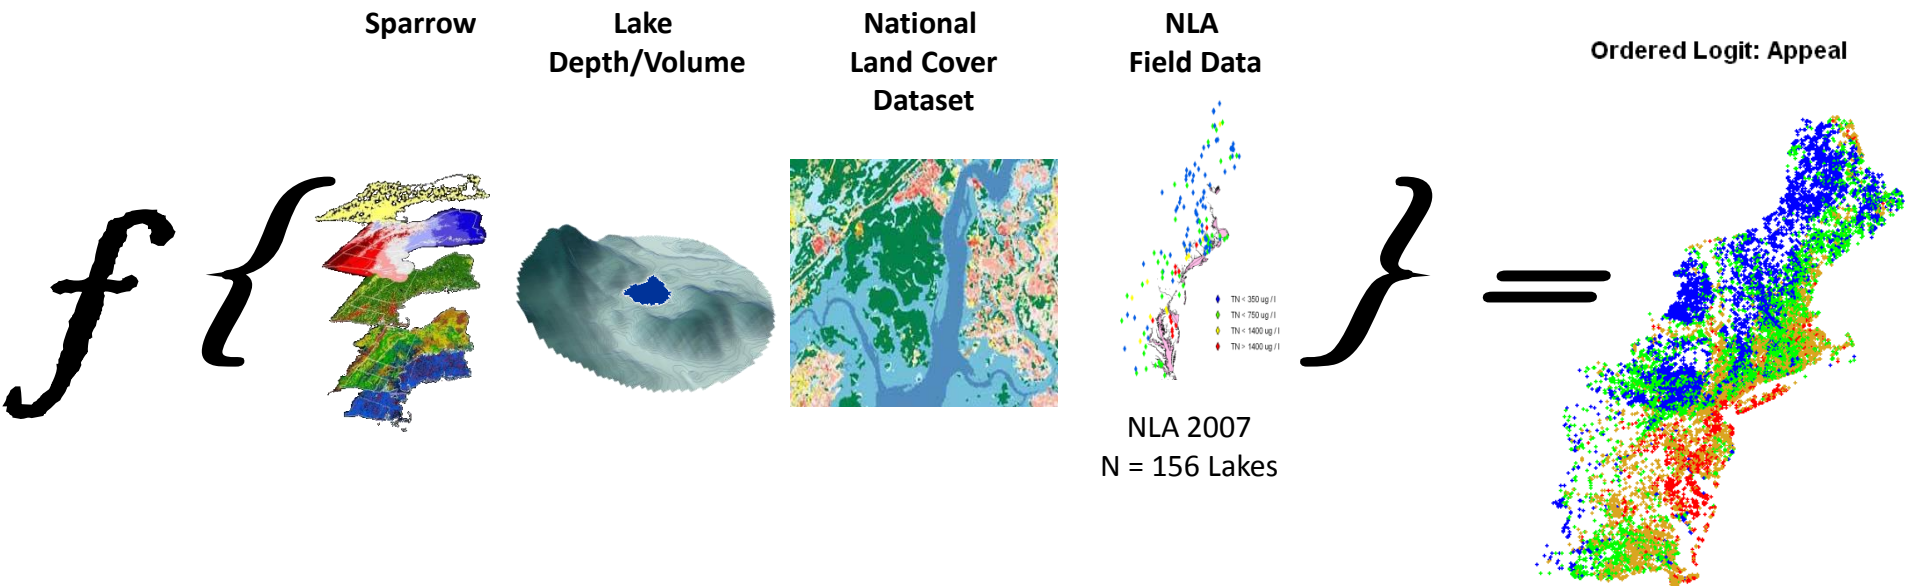

Written Comments from Lakes in Highest Appeal Categories

Nutrients and Ecosystem Services

Modeling Lake Aesthetics/Appeal

Modeling Lakes Aesthetics

Ordered Logit Model

Predictor Variables

- **Chlorophyll *a*** ($\mu\text{g/l}$)
- Elevation (m)
- Shoreline (m)
- Flow
- Shoreline Development
- Area (m^2)
- Max Depth (m)
- Volume (m^3)
- Hydraulic Residence Time (years)
- Proximity to People

Response Variables

- **Appeal Score**
- Pristine Score
- Recreation Score
- Swimming Score
- Biotic Integrity Score
- Secchi Depth Class
- Microcystin Detected
- Cyanobacteria Count Class

1.) Start with field data

2.) Combine with landscape data in function

3.) Predict Appeal for ~18,000 Lakes

Estimating Maximum Lake Depth and Lake Volume

Background

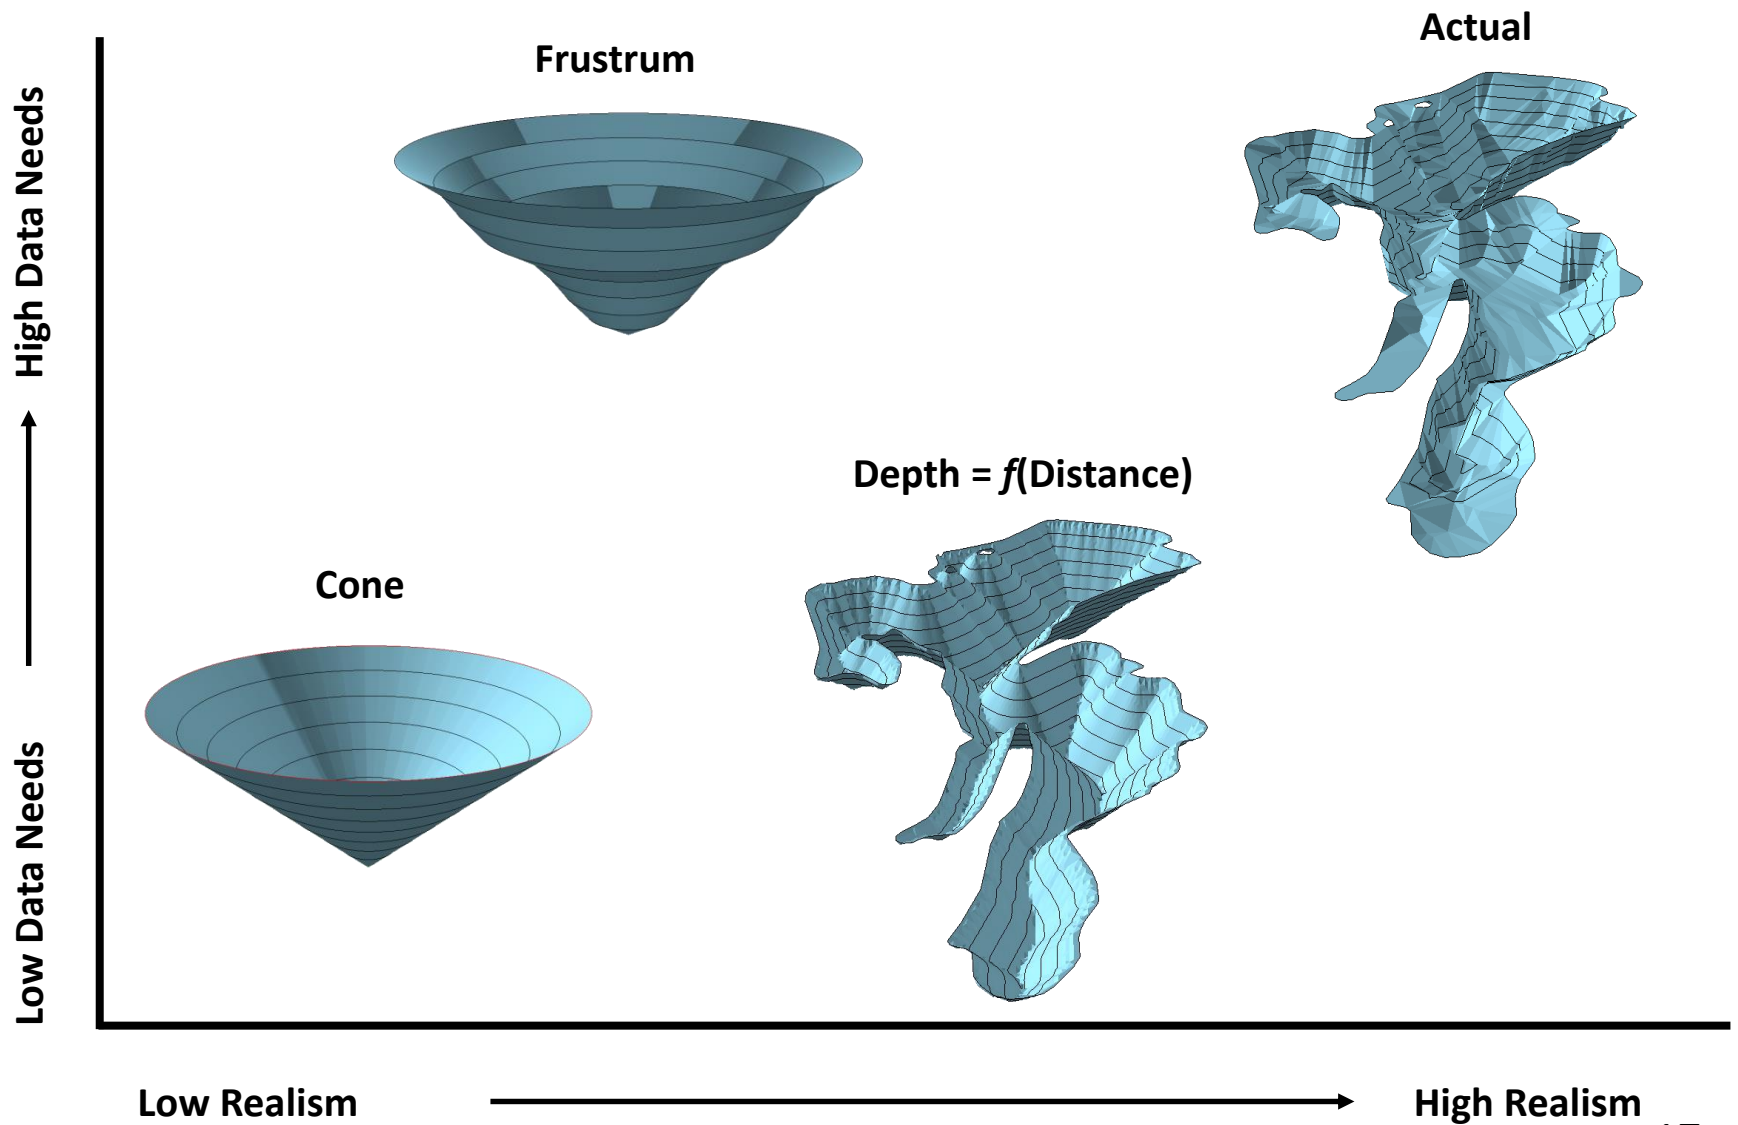

- Ordered Logit Models
 - Need Residence time
- Existing data
 - Limited resources
 - ~18,000 Lakes

Problem #1

What is the best way to estimate lake volume given, lake shoreline and maximum depth?

Citation: Hollister, J. W., W.B. Milstead (2010). Using GIS to Estimate Lake Volume from Limited Data. *Lake and Reservoir Management*. 26(3)194-199. Contribution no. AED-10-018.

Methods (aka The GIS Method)

- Assume that depth is function of distance from shore
- Rasterize Lake

- Simple linear transformation based on assumption

$$\text{Depth} = \text{PixelDist} * \frac{\text{MaximumDepth}}{\text{MaximumDistance}}$$

- Calculate volume

$$\text{LakeVolume} = \sum \text{CellArea} * \text{Depth}_{i,j}$$

Methods

Partridge Lake
Bathymetry Data

- Accuracy Assessment
 - Bathymetry data
 - NH DES for 132 lakes
 - Created TIN for each lake
 - Calculated volumes
 - Cone v TIN
 - GIS Method v TIN

Results - Volume Error Analysis

Method	RMSD	MD	MAD	P(Better)
GIS – All Lakes	3,287,360	8622	200734	0.59
Cone – All Lakes	6,975,740	608967	225502	0.41

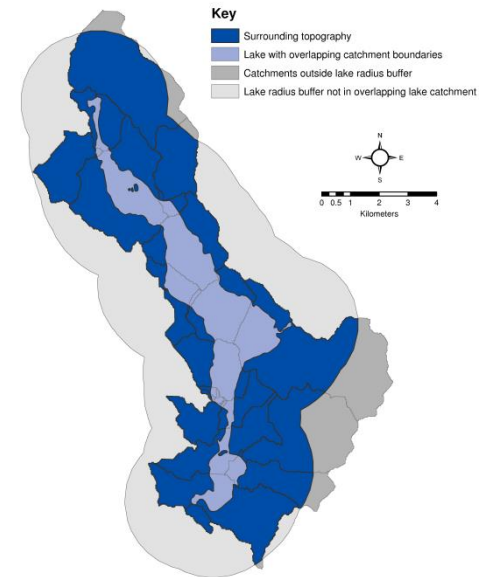

Problem #2

- Method in Problem #1 assumes a measurement of maximum lake depth is available
- Is it possible to create a reasonable estimate of lake depth from the topography surrounding a lake?

Citation: Hollister, J. W., W.B. Milstead, M.A. Urrutia (2011). Predicting Maximum Lake Depth from Surrounding Topography. *PLoS ONE* 6(9): e25764. doi:10.1371/journal.pone.0025764. Contribution no. AED-11-013

Predicting Maximum Lake Depth

- Select surrounding topography
- Determine median slope
- Determine maximum distance in lake
- Depth
 - $\text{Max.Dist} * \text{Median.Slope}$

Assessing the method

- Compare to measured data
 - National Lakes Assessment Data
 - Bootstrapped Cross-validation
 - Web reported depths
- Over predicts
- Fit NLA model
- Use NLA model to correct
- RMSE: ~5-6m
- Correlation: ~0.7

Using Volume Estimates

- Useful if they improve understanding of processes
- Tested
 - USGS SPARROW TN and TP loading estimates
 - Calculate residence time with volume and flow
 - Compare estimates to measured concentrations in lakes.
 - National Lake Assessment

Nitrogen Concentration Comparison

Sparrow Model Estimate

NLA TN vs. Sparrow CN

Sparrow Observed Log Nitrogen Load Concentration
Without Volume Estimate; r-squared= 0.4092

Modified Vollenwieder Estimate

Conic Volume

$\log_{10}(\text{CN}) / (1 + (0.2 * \text{HRT}^{**} 0.21))$

Sparrow Predicted Log Total Nitrogen
With Conic Volume Estimate; r-squared= 0.559

Modified Vollenwieder Estimate

GIS Volume

$\log_{10}(\text{CN}) / (1 + (0.2 * \text{HRT}^{**} 0.22))$

Sparrow Predicted Log Total Nitrogen
With GIS Volume Estimate; r-squared= 0.5712

Ecosystem Services Beneficiaries

Beneficiaries

- Populations most likely to benefit

How do we connect people with services?

Dasymetric Population Modeling

- Redistributing values from one geography to another based on ancillary data

• Rhode Island Example:

Cen2001 BNL Groups

-  Open Water
-  Low Intensity Residential
-  High Intensity Residential
-  Commercial/Industrial/Transportation
-  Bare Rock/Sand/Clay
-  Quarries/Strip Mines/Gravel Pits
-  Transitional
-  Deciduous Forest
-  Evergreen Forest
-  Mixed Forest
-  Shrubland
-  Orchards/Vineyards/Other
-  Grasslands/Herbaceous
-  Pasture/Hay
-  Row Crops
-  Small Grains
-  Fallow
-  Urban/Recreational Grasses
-  Woody Wetlands
-  Emergent Herbaceous Wetlands

Dasymetric Mapping

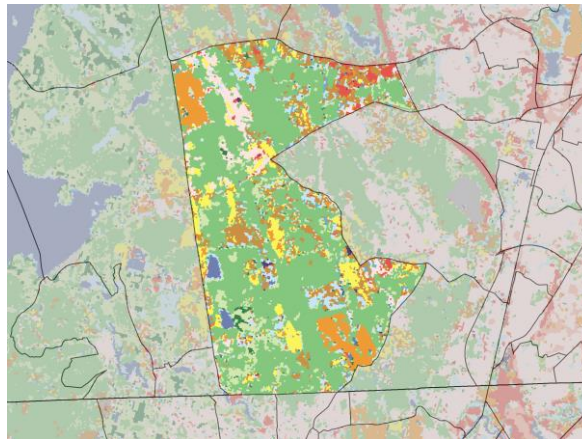

Census Block Group

Population: 2714

Population/pixel: 0.11

2001 NLCD

Populated Mask

Population: 2714

Population/pixel: 0.17

Dasymetric Mapping

Three Reduction Scenarios

What are the benefits to lakes?

* P reduction for Urban and Agriculture Scenarios Only

New England (HUC 01)

Air Scenario

534 Improved Lakes

Total Lakes = 8380

Urban Scenario

306 Improved Lakes

Total Lakes = 8380

Agriculture Scenario

579 Improved Lakes

Total Lakes = 8380

HUC 01

MRB1_MapScenarios20111101.r

Poor to Fair

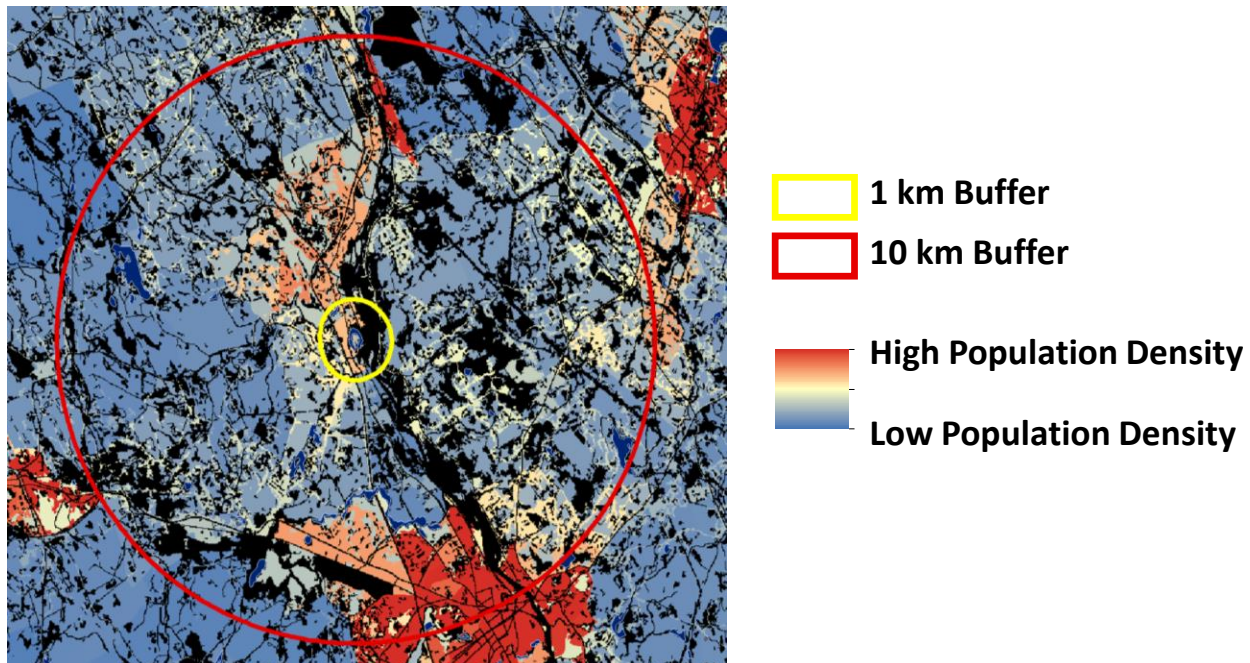

Fair to Good

Good to Best

Compare to Population

- Calculate total population for each improved lake
- Multiple Scales: 1km, and 10km

New England (HUC 01)

Population within 1km of Improved Lakes

Population = 187,838

Air Scenario

Population = 545,769

Urban Scenario

Population = 136,421

Agriculture Scenario

Number of Improved Lakes

534 Improved Lakes

Total Lakes = 8380

306 Improved Lakes

Total Lakes = 8380

579 Improved Lakes

Total Lakes = 8380

Poor to Fair

Fair to Good

Good to Best

Scarcity

- Landscape Lake Aesthetic Index (LLAI)

$$LLAI_{i,j} = \sum 1/D * Appeal$$

$$D_1 = 1/30 * 4 = 0.13$$

$$D_2 = 1/60 * 5 = 0.083$$

$$D_3 = 1/120 * 5 = 0.041$$

$$\Sigma = 0.254$$

will provide estimate of each pixels
potential to receive aesthetic services
from lakes

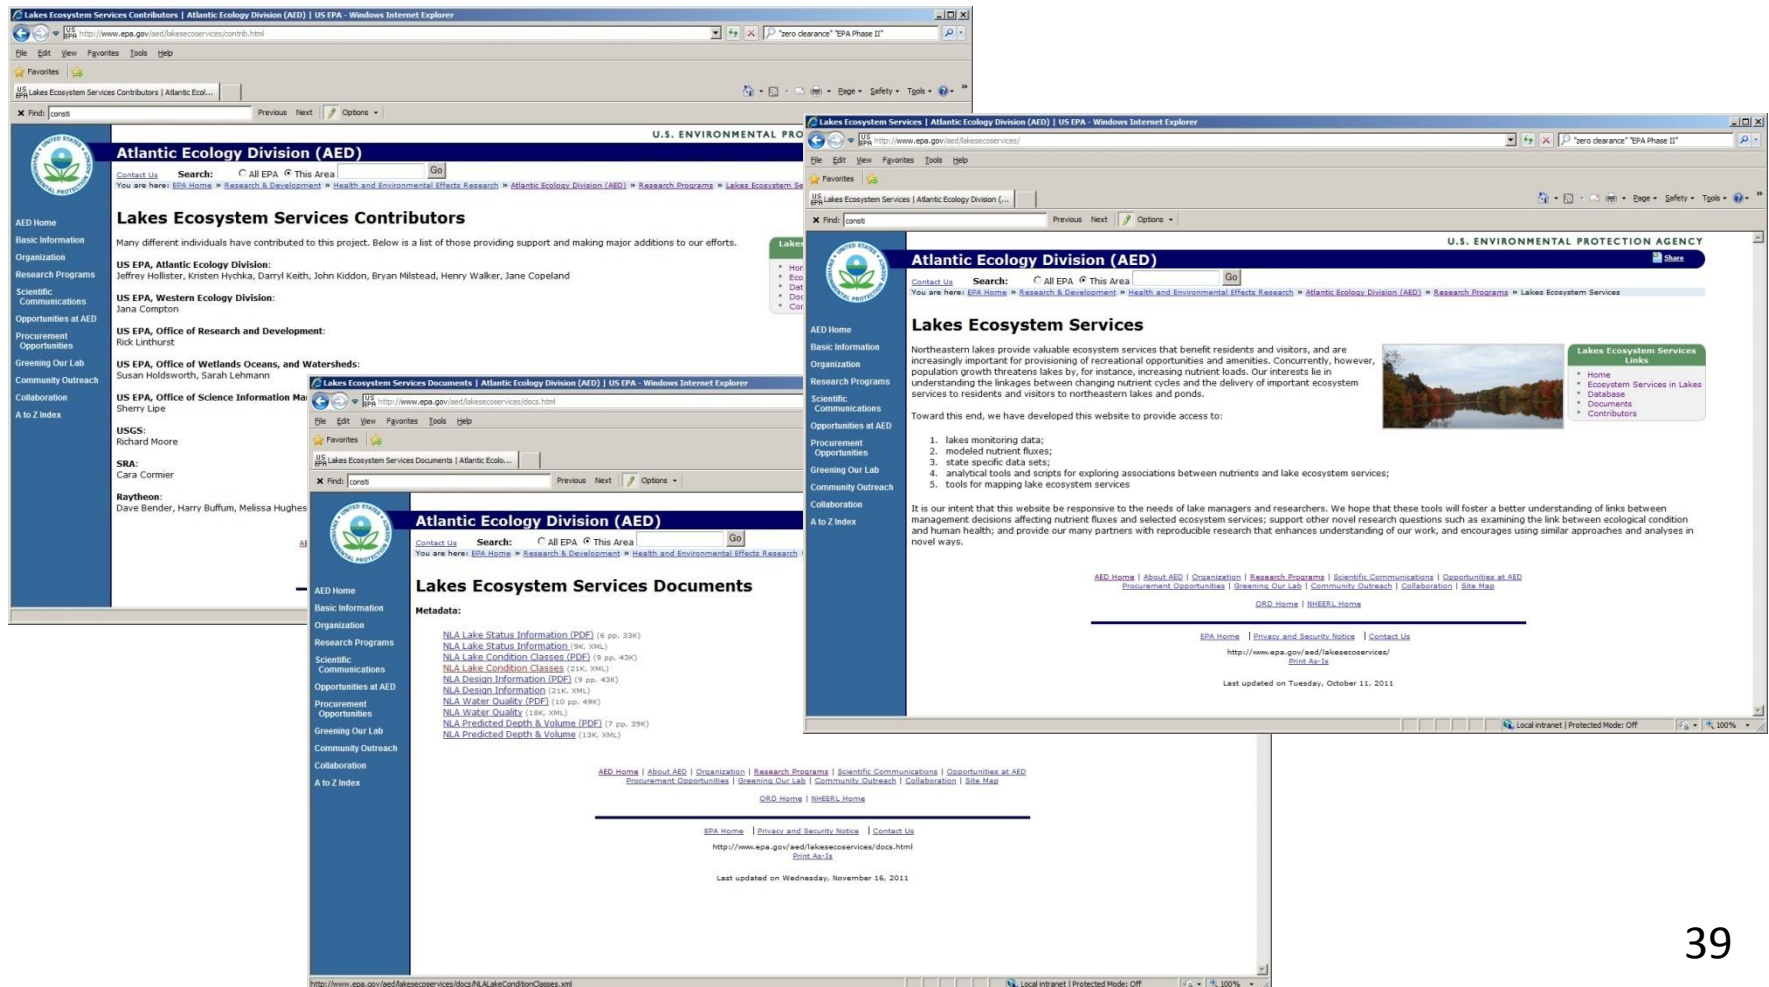

Landscape Lakes Aesthetic Index

Decision Support

What's Next: Economics, Cyanobacteria, and Human Health

Cyanobacteria Integrated Approach

Expected Products

- Models predicting cyanobacteria abundance and probability of human toxicity risk
- Better understanding of cyanotoxin effects on mammalian endpoints
- Decision support system to estimate changes in human health risk and economic impact due to a variety of nutrient reduction scenarios

Economic Analysis

- Combine
 - Policy Relevant Scenario Analysis
 - Beneficiaries
 - Access to Services & Substitutes (Landscape Lake Aesthetic Index)
 - Public Values (Is a change from Good to Best of the same value as a change from Fair to Good?)
 - Environmental Justice

Questions?

Methods

- Is assumption that $\text{Depth} = f(\text{Distance})$

Pratt Pond

Clark Pond

Diamond Pond
